I. TECHNICAL DATA

POWER AMPLIFIER SECTION

RATED OUTPUT POWER 2-CHANNELS DRIVEN	120 watts per channel, minimum RMS, at 8 ohms from 20 to 20,000 Hz with no more than 0.06% total harmonic distortion.
FREQUENCY RESPONSE	(MAIN-IN) DC to 100 kHz +0, -0.5 dB
POWER BANDWIDTH (IHF)	10 Hz to 40 kHz/8 ohms (Total Harmonic Distortion: 0.06%)
SIGNAL TO NOISE RATIO (IHF) PHONO	Better than 80 dB
AUX	Better than 100 dB
RESIDUAL NOISE	Less than 0.5 mV at 8 ohms
CHANNEL SEPARATION (IHF) PHONO	Better than 50 dB at 1,000 Hz
DAMPING FACTOR	More than 50 (1 kHz, 8 ohms)
OUTPUT: SPEAKERS	A, B, C (4 to 16 ohms)/A+B, A+C, B+C (8 to 16 ohms)
HEADPHONE	4 to 16 ohms

PRE AMPLIFIER SECTION

INPUT SENSITIVITY/IMPEDANCE PHONO	PHONO 1: 3 mV/33/47/100 kohms, PHONO 2: 3 mV/47 kohms
AUX	150 mV/100 kohms
TUNER	150 mV/100 kohms
TAPE MONITOR	PIN: 150 mV/100 kohms DIN: 150 mV/100 kohms
MAIN IN	PIN: 1 V/47 kohms
OUTPUT LEVEL/IMPEDANCE TAPE REC	PIN: 150 mV/1 kohms DIN: 30 mV/30 kohms
PRE OUTPUT	1 V/4.7 kohms
FREQUENCY RESPONSE PHONO (RIAA equalization)	30 Hz to 15 kHz +0.5 dB, -0.5 dB
AUX, TAPE MONITOR	3 Hz to 60 kHz +0 dB, -1 dB
TONE CONTROL	±10 dB at 100 Hz, 1 kHz, 4 kHz, 10 kHz
LOUDNESS CONTROL	+10 dB at 100 Hz, +6 dB at 10 kHz (Volume control set at -30 dB position)
FILTER: HIGH	-6 dB at 8.12 kHz
LOW	-6 dB at 15.30 Hz
AUDIO MUTE	-15 dB, -30 dB

MISCELLANEOUS

SEMICONDUCTORS	Transistors: 47, Diodes: 31, IC: 2
POWER REQUIREMENTS	120 V, 60 Hz for USA and Canada 220 V, 50 Hz for Europe Except UK 240 V, 50 Hz for UK and Australia 110/220/240 V, 50/60 Hz Switchable for the other countries
DIMENSIONS	440 (W) x 170 (H) x 430 (D) mm (17.3 x 6.7 x 16.9 inches)
WEIGHT	17.8 kg (39.2 lbs)

* For improvement purposes, specifications and design are subject to change without notice.

II. DISMANTLING OF UNIT

In case of trouble, etc. necessitating dismantling, please dismantle in the order shown in the photographs. Resemble in reverse order.

V. OPERATING PRINCIPLES

Fig. 4

1. Differential Amplifier and Current Mirror Circuit (Refer to Fig. 4)

A current mirror circuit composed of TR2A and TR2B is included as a load resistance for TR1A and TR1B which compose the Differential Amplifier. When TR1A base potential increases, the voltage between the TR1A base and the emitter decreases and TR1A collector current decreases.

Since TR1 is a dual transistor differential amplifier, TR1B collector current increases proportionately to TR1A collector current decreases. The current flowing to TR2B also increases and this increases TR2B collector potential. Since the base and the collector are connected for TR2B and TR2B collector connected to TR2A base, TR2A base potential increases by the same amount as the TR2 base potential. (V_{BE} increase) This becomes a force to increase TR2A collector current but the TR1A collector current and the TR2A collector current must be equal.

Looking at the internal resistance of TR1A and TR2A, we find that the results are:

- Decrease in voltage between base and emitter
→ increase in internal resistance
- Increase in voltage between base and emitter
→ decrease in internal resistance

Since equal amount of collector current flow to increase TR1A internal resistance and decrease TR2A internal resistance, both TR1A collector potential and TR2A collector potential rise. These two changes of potentials directly becomes the output, and TR1A and TR1B push-pull outputs combine to become the input voltage of the next stage.

The advantages of the current mirror circuit include a gain of more than two times (6 dB), low distortion at high frequencies, good rise-up characteristics, and good temperature characteristics.

Fig. 5 D.C Balance

Fig. 5 shows the circuit for DC Balance.

With DC amplifier, voltage arising in the center point causes the direct current flow to the speakers and thus result in speaker distortion.

Balancing out is necessary even in the first stage differential amplifier where center point potential arises out of temperature change and differences in transistor performance.

The circuit composed of R3, R4, R5, R6, VR1, VR2, D1, and D2 is the DC balance circuit.

To balance, it is necessary to minimize the change of V_{BE} .

When the temperature rises, TR1 V_{BE} and the collector current increase to cause the base potential to rise.

On the other hand, the silicon diodes (D1 and D2) connected to the base show very little change (0.6 - 0.7V) in the forward voltage drop and function to maintain the TR1 base potential stabilized.

VR1 and VR2 set the base voltage so that TR1A and TR1B collector currents are the same.

Also, in this model, to minimize influence from the temperature outside, TR1 and TR2 are heat coupled by the shield box.

Fig. 6 Idling Current Supply Circuit & Temperature Compensation

2. Idling Current Supply Circuit and Temperature Compensation (Refer to Fig. 6)

Looking at the idling current's temperature compensation, when TR7 collector current I_o increases due to a rise in temperature, V_{BE} of TR6 and TR6 collector current increase. This causes the V_{BE} of TR7 and TR7 collector current to decrease, thus maintaining idling current's stability.

Also, because the thermistor has a negative temperature characteristic I_o increase leads to an increase of TR6's V_{BE} and TR6 collector current.

Fig. 7

Fig. 7 shows the constant-current load circuit. Its operation can be described as follows.

By making TR3 base constant voltage through D3, R14 and R15, a fixed current flows to TR3.

When there is no signal at TR3, the same I_{DC} flowing to TR3 flows to TR4. But when a positive half cycle is supplied to the TR4 base, TR4 collector current becomes more than the I_{DC} . And since TR3 is fixed by the constant current I_{DC} , Δi flows from the next stage to TR4, resulting in a flow of $I_{DC} + \Delta i$ to TR4. On the other hand, when a negative half cycle is supplied to TR4, TR4 collector current becomes less than I_{DC} . But because constant current I_{DC} flows to TR3, Δi of constant current flows to the next stage. Therefore, TR4 receives $I_{DC} - \Delta i$ current. As above, change in the TR4 current Δi flows only to the next stage.

Fig. 8 Mute Circuit

3. Mute Circuit (Refer to Fig. 8)

When the amplifier power is turned OFF or ON, the popping sound and distortion occur to damage the speakers and produce unpleasant noise.

This is prevented by the circuit shown in Fig. 8. When the power is turned ON, TR15 base is reverse biased through D12, C20, R49, R54, and R55 and is put into an OFF condition.

TR16 base potential decrease with C18 charging current coming through R50 and turns on TR16 after a fixed time. The relay (RL1) is put into operation at this point, and the main amplifier and the speakers are connected.

When the power is turned OFF, the reverse bias supplied to TR15 gradually disappears to turn on TR15. Thereby, C18 discharges through TR15 and turns OFF. TR16. The relay (RL1) turns OFF and the main amplifier and the speakers are disconnected at the same time.

Fig. 9 Overcurrent Detection Circuit

4. Overcurrent Detection Circuit (Refer to Fig. 9)

Output stage transistor may break down because of excess current or excess power consumption by the transistor when the output terminal of the power amplifier is shortcircuited or when too many speakers are connected and the load impedances are too low equivalently.

This is prevented by the circuit in Fig. 9.

Ordinarily, the base potential and the emitter potential of TR13 are equal and TR13 is maintained OFF. When the load R_L becomes lower than the power amplifier's rated or shortcircuited, TR13 base potential becomes greater than the emitter potential (V_{BE} increase) and TR13 is turned ON. When TR13 is turned ON, TR14 base potential decrease according to the voltage drops at R44. TR14 then becomes ON, TR15 base potential decrease and TR15 becomes ON. C18 rapidly discharges and TR16 base potential increase, and TR16 turns OFF to cut off the speakers from the main amplifier. C12 is a condenser to prevent malfunction by noise.

D4 and D5 are temperature compensation diodes for TR13.

Even when there is an increase in the drift current due to a rise in temperature and there is an increase in voltage between TR13 base and emitter, TR13 base potential do not change because the silicon diode D4 forward voltage drop is fixed. The increase of TR13 collector current is thereby withheld.

Fig. 10 Center Point DC Voltage Detection Circuit

5. Center-Point Voltage Detection Circuit (Refer to Fig. 10)

When such emergency occurs as a shortcircuit between the collector and the emitter of one of the power amplifier output transistors, direct current potential appears at the output terminal and, with the OCL circuit, the direct current flows to and damages the speakers.

This is prevented by the circuit in Fig. 10.

Ordinarily, center point potential is 0 V and therefore TR17 and TR18 are OFF. Also, since C21 and C22 are connected to the chassis, TR17 and TR18 are not affected by the AC signal.

But when the center point potential changes and a positive DC potential appears, this voltage becomes TR18 base bias and turns on TR18.

Consequently, TR14 and TR15 of the next stage turn ON and TR16 turns OFF to disconnect the main amplifier and the speakers.

Also when a negative DC potential is generated at the center point, TR17 emitter potential becomes lower than the base potential (V_{BE} increase) and TR17 is turned ON. Consequently, TR14 and TR15 are turned ON and TR16 is turned OFF to disconnect the main amplifier and the speakers.

Fig. 11

Fig. 12

6. L1 and R35 Operation (Refer to Fig. 11, 12)

Fig. 11 shows the circuit. Fig. 12 shows the equivalent circuit.

Looking at the shortcoming first, we find that when an inductance or a resistor is added between the power amplifier output and the speaker, in case of an inductance there is a disadvantage of greater and greater power amplifier output impedance in the high frequencies. But actually it is only about 0.014 ohms at 1 kHz and 1.4 ohms at 100 kHz.

Therefore it can be said that it is negligible.

Looking at the advantages, we find the following. When the load is connected to something with a capacitive component, it forms a series resonance circuit and load impedance is zero at the resonance point. But by the workings of R connected in parallel to L, the resonance circuit is damped and a pure resistance is seemingly added equivalently in series so that the load impedance does not become zero even at the resonance point.

This works as a buffer to various kinds of effect coming from the load side. For example, it can maintain the load impedance above a fixed value even if a 3-way or 4-way speaker with a built-in L-C network is connected.

VI. LEVEL DIAGRAM

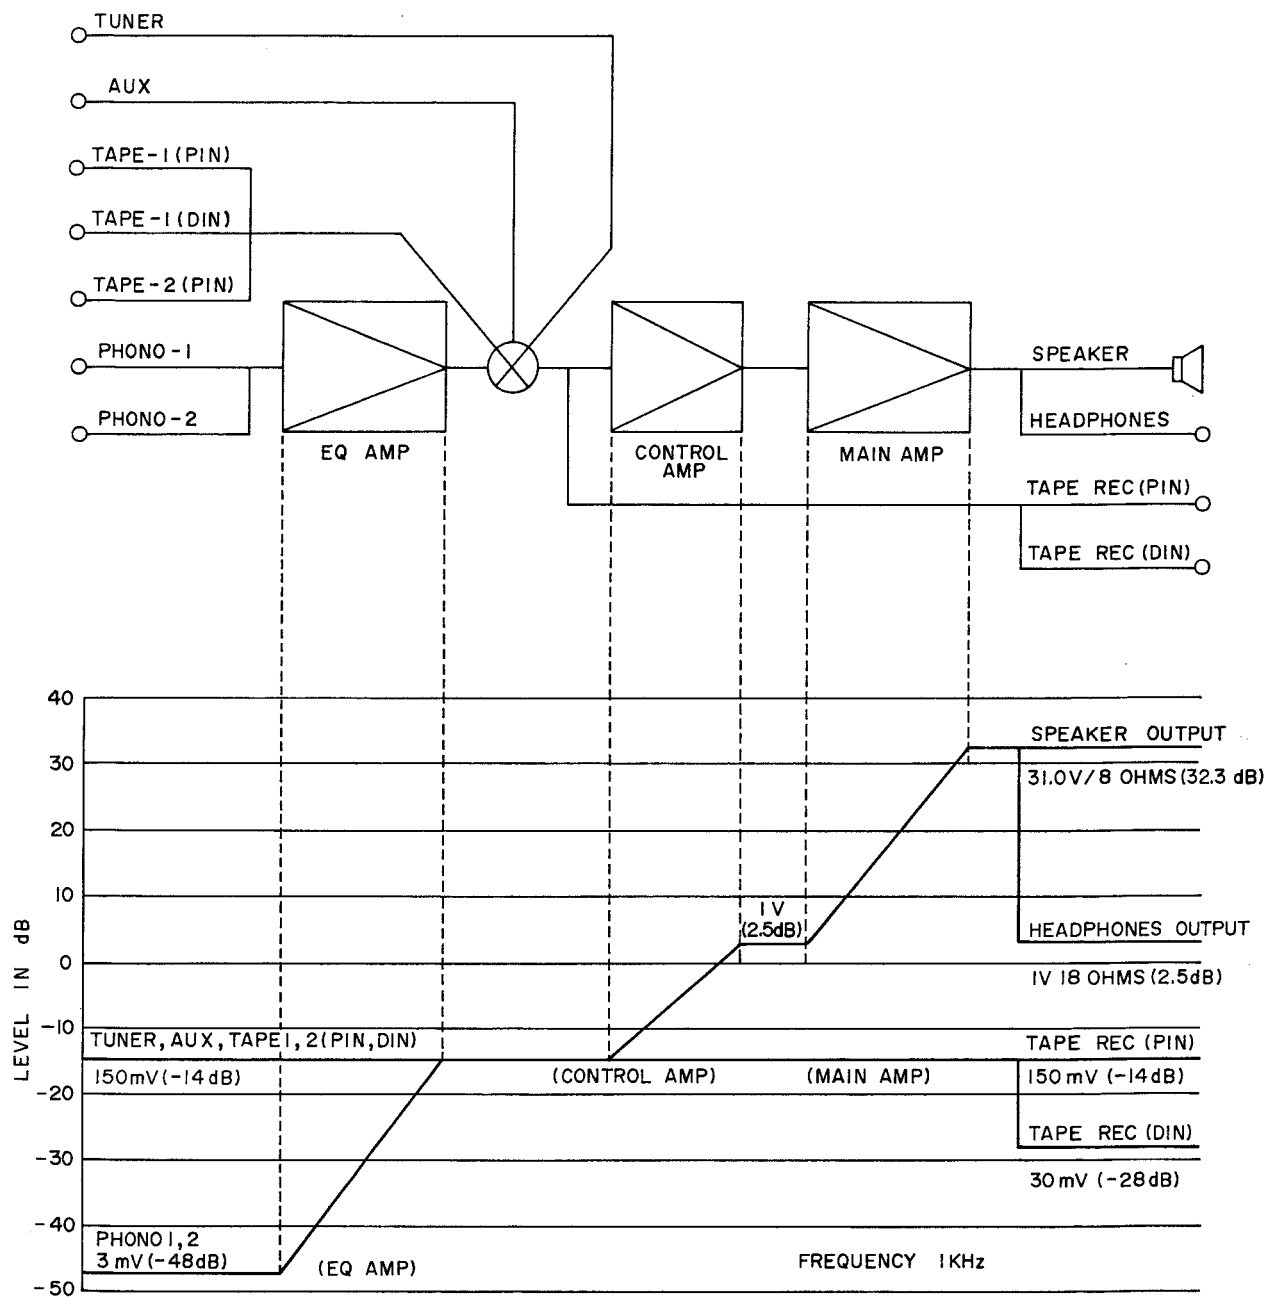

Fig. 13 Level Diagram

VII. AMPLIFIER ADJUSTMENT

NOTE: The letter "b" added to each part symbol in the following figure denotes the right channel

Fig. 14 Main Amp Adjust Point

Fig. 15 Idling Current Adjustment Instrument Connection

1. Idling Current Adjustment (Refer to Fig. 14, 15)

- 1) Disconnect the jumper plugs from the PER OUT and MAIN IN terminals on the rear panel.
- 2) Keep the SPEAKERS Switch on the front panel in the OFF position. Now, follow the directions in Table 1 below.

Table 1 Idling Current Adjustment

Step	Item	Adjust:	Result	Method
3	Idling current (Left channel)	VR3 1 k Ω (Main Amp P.C Board)	20 mV	Use a VOM or VTVM with it in 100 mV DC range. The idling current should be 20 mA
4	Idling current (Right channel)	VR3b 1 k Ω (Main Amp P.C Board)	20 mV	

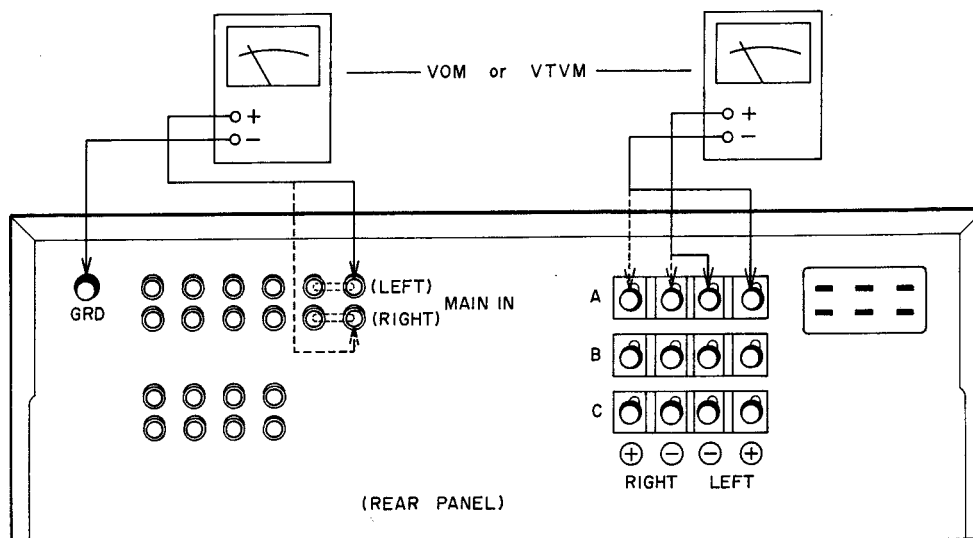

Fig. 16 DC Balance Adjustment Instrument Connection

2. DC Balance Adjustment (Refer to Fig. 14, 16)

- 1) Disconnect the jumper plugs from the PRE OUT and MAIN IN terminals on the rear panel.
- 2) Keep the SPEAKERS switch on the front panel in the A position.
- 3) For the left-channel DC balance, turn VR2 (50 k Ω) until the input voltage at the MAIN IN (LEFT) terminal is around 0 V.
- 4) Turn VR1 (50 k Ω) until the output voltage at the SPEAKER A (LEFT) terminal is around 0 V.
- 5) Repeat Steps 3) and 4) until the input and output voltages are within ± 1 and ± 20 mV, respectively.
- 6) Similarly, adjust VR2b (50 k Ω) and VR1b (50 k Ω) for the right-channel DC balance until the input and output voltage at the SPEAKER A (RIGHT) terminal is within ± 1 and ± 20 mV, respectively.

3. Level Meter Indication Adjustment (Refer to Fig. 14, 17, 18)

Set-up

- 1) Connect an AF oscillator to the AUX jacks on the rear panel as illustrated in Fig. 17.
- 2) Connect an 8-ohms load across each SPEAKER A terminal as illustrated.
- 3) Connect an AC voltmeter across the load.
- 4) Set the SPEAKERS selector to the A position.
- 5) Set the TONE controls and BALANCE control to their mechanical centers ("0").
- 6) Throw the MODE switch into the MONO position.
- 7) Keep the LOUDNESS switch in the OFF position.
- 8) Set the SELECTOR switch to the AUX position.
- 9) Set the AUDIO MUTE, FILTER LOW and HIGH, and TONE switches to the OFF position.

Fig. 17 Level Meter Indication Adjustment Instrument Connection

Procedures

- 1) Turn on the AF oscillator and under adjustment.
- 2) Set the AF oscillator output frequency to 1,000 Hz and the level to 150 mV.
- 3) Adjust the VOLUME control on the front panel until the VTVM reads 31.0 V.
- 4) Now, adjust VR4 (Right) on the Main Amp P.C board (see Fig. 14) until each POWER LEVEL meter deflects to the mark "120". (see Fig. 18)

Fig. 18 Level Meter

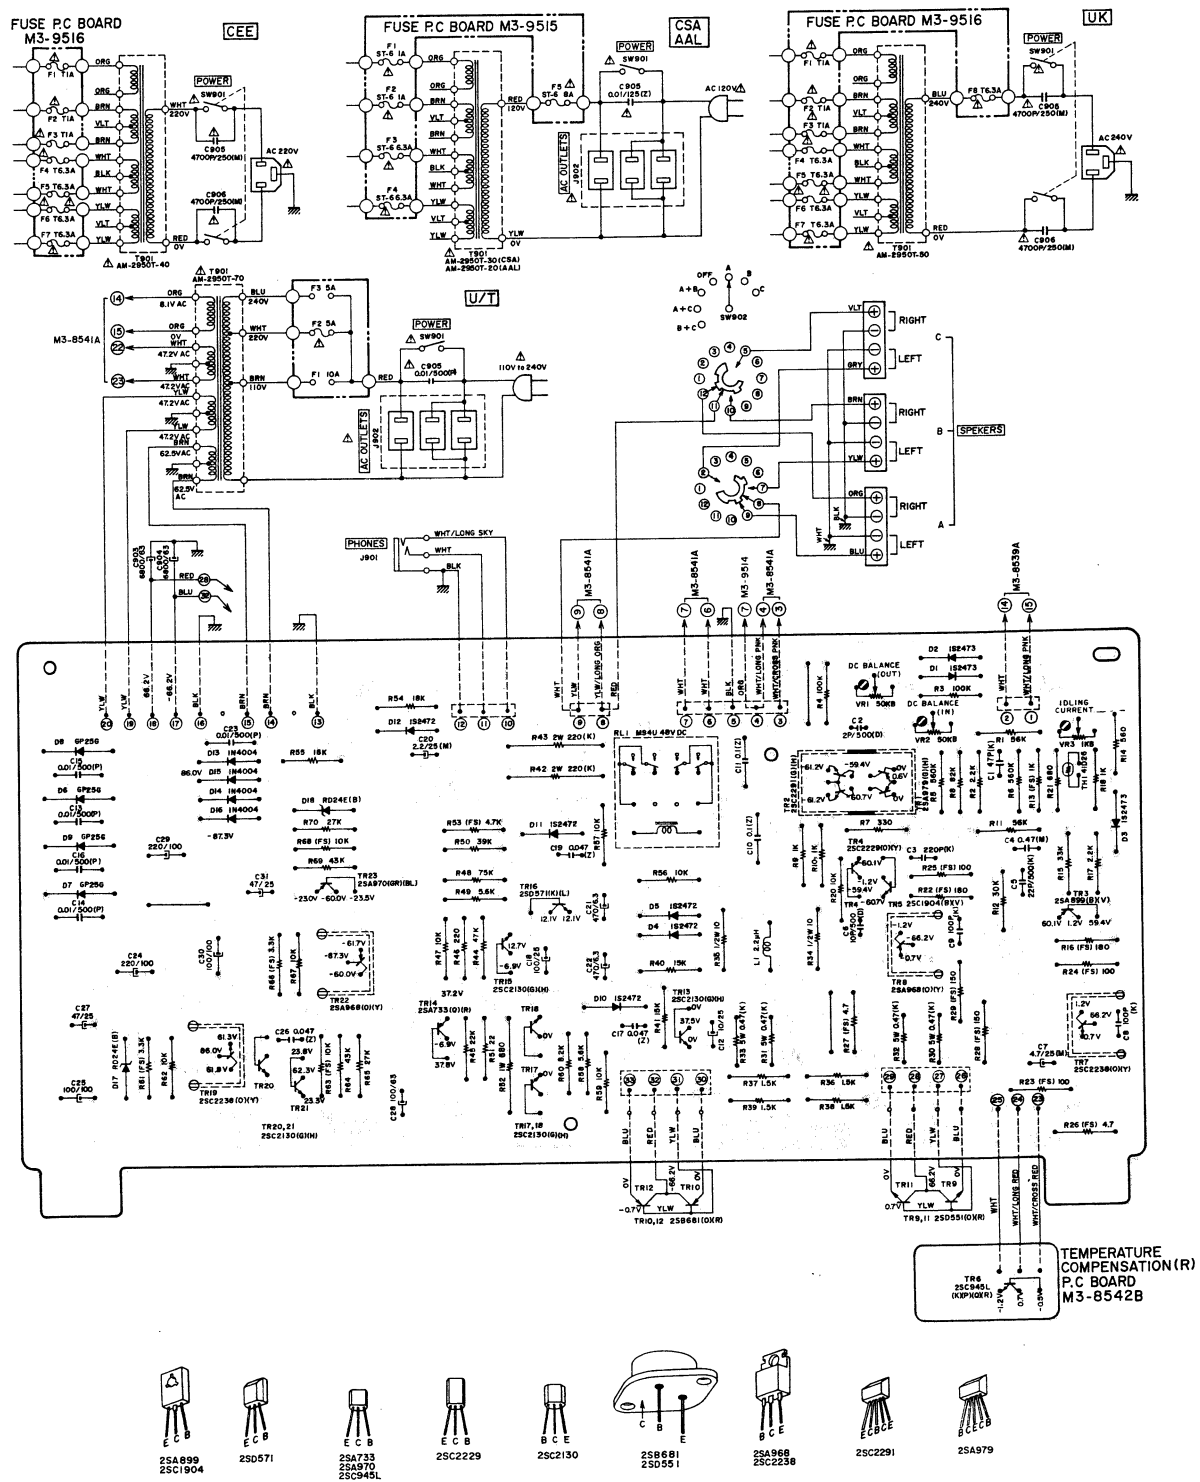

VIII. CLASSIFICATION OF VARIOUS P.C BOARDS

1. P.C BOARD TITLES AND IDENTIFICATION NUMBERS

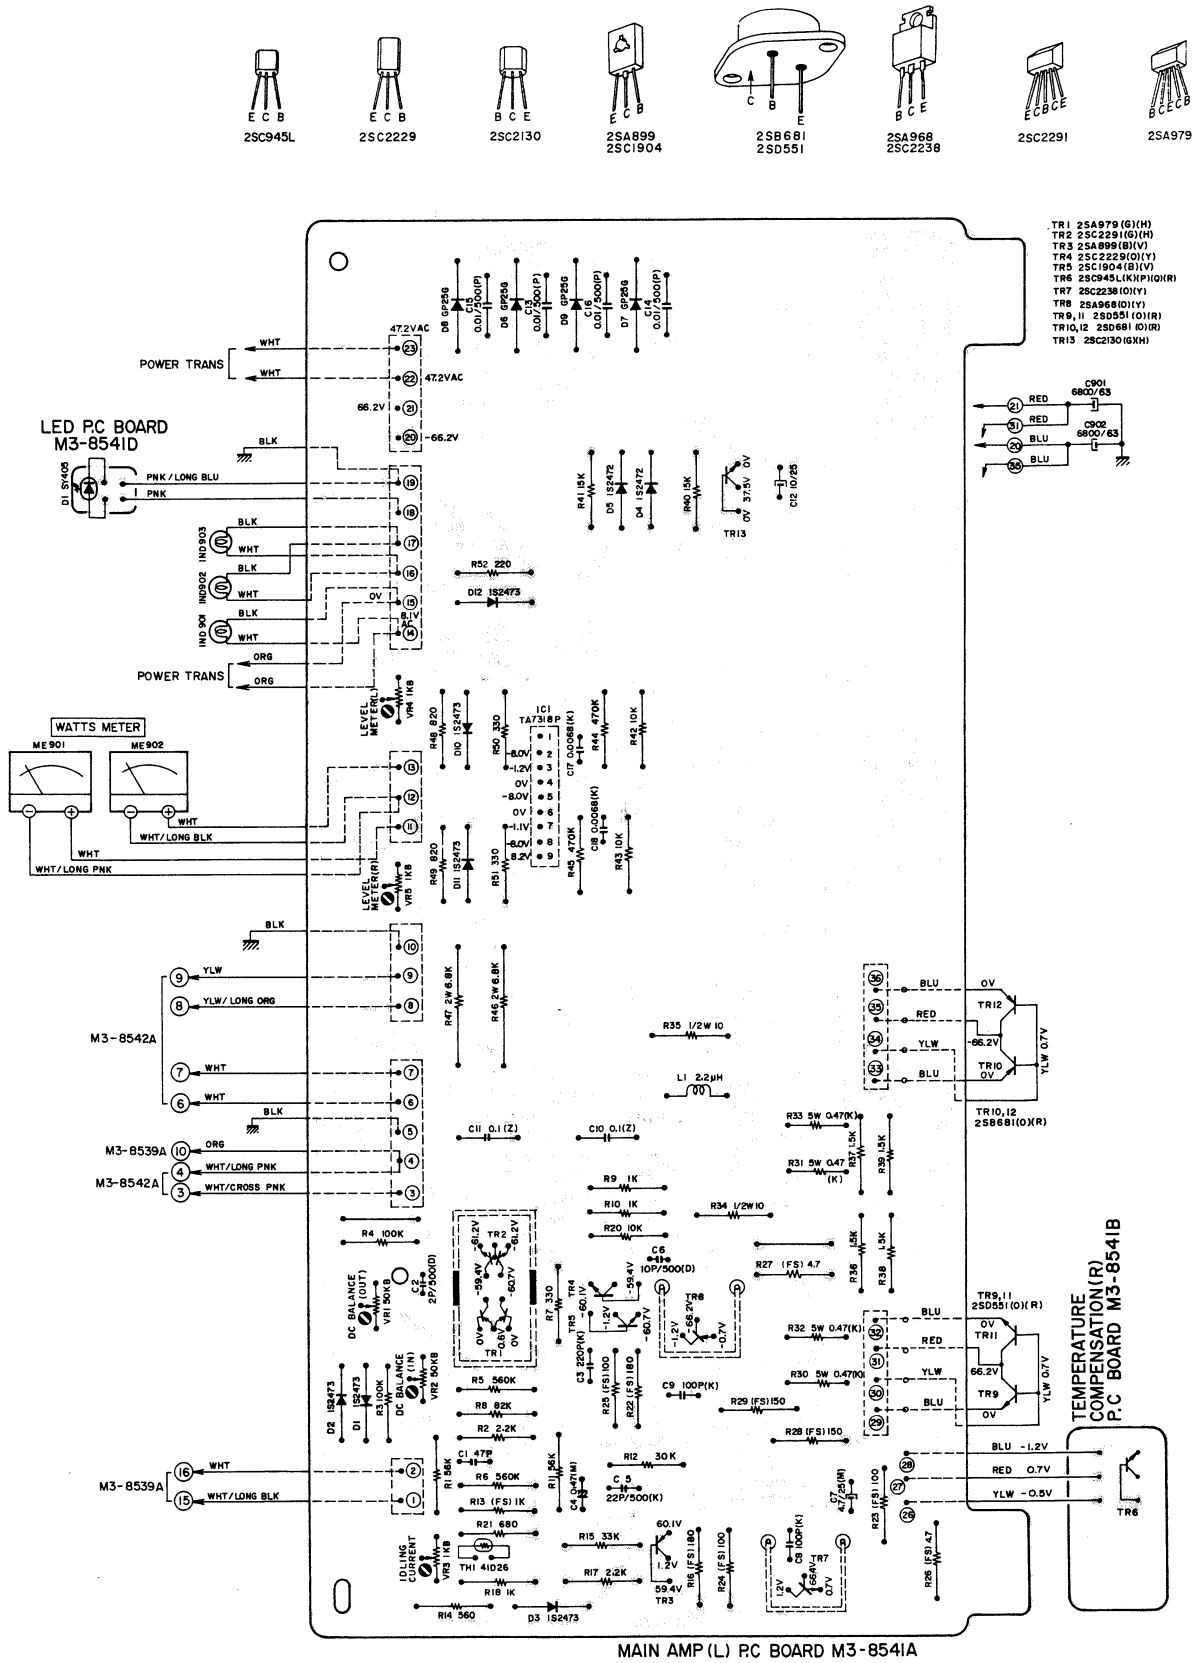

P.C Board Title	P.C Board Number
Main Amp (L) P.C Board	M3-8541A
Main Amp (R) P.C Board	M3-8542A
Tone Control P.C Board	M3-9514
Equalizer P.C Board	M3-8539A
Tape P.C Board	M3-8539B
Volume P.C Board	M3-9513A
Balance P.C Board	M3-9513B
Temperature Compensation (L) P.C Board	M3-8541B
Temperature Compensation (R) P.C Board	M3-8542B
LED P.C Board	M3-8541D
Fuse P.C Board (U/T)	M3-8543
Fuse P.C Board (CSA, AAL)	M3-9515
Fuse P.C Board (CEE, UK)	M3-9516

2. COMPOSITION OF VARIOUS P.C BOARDS

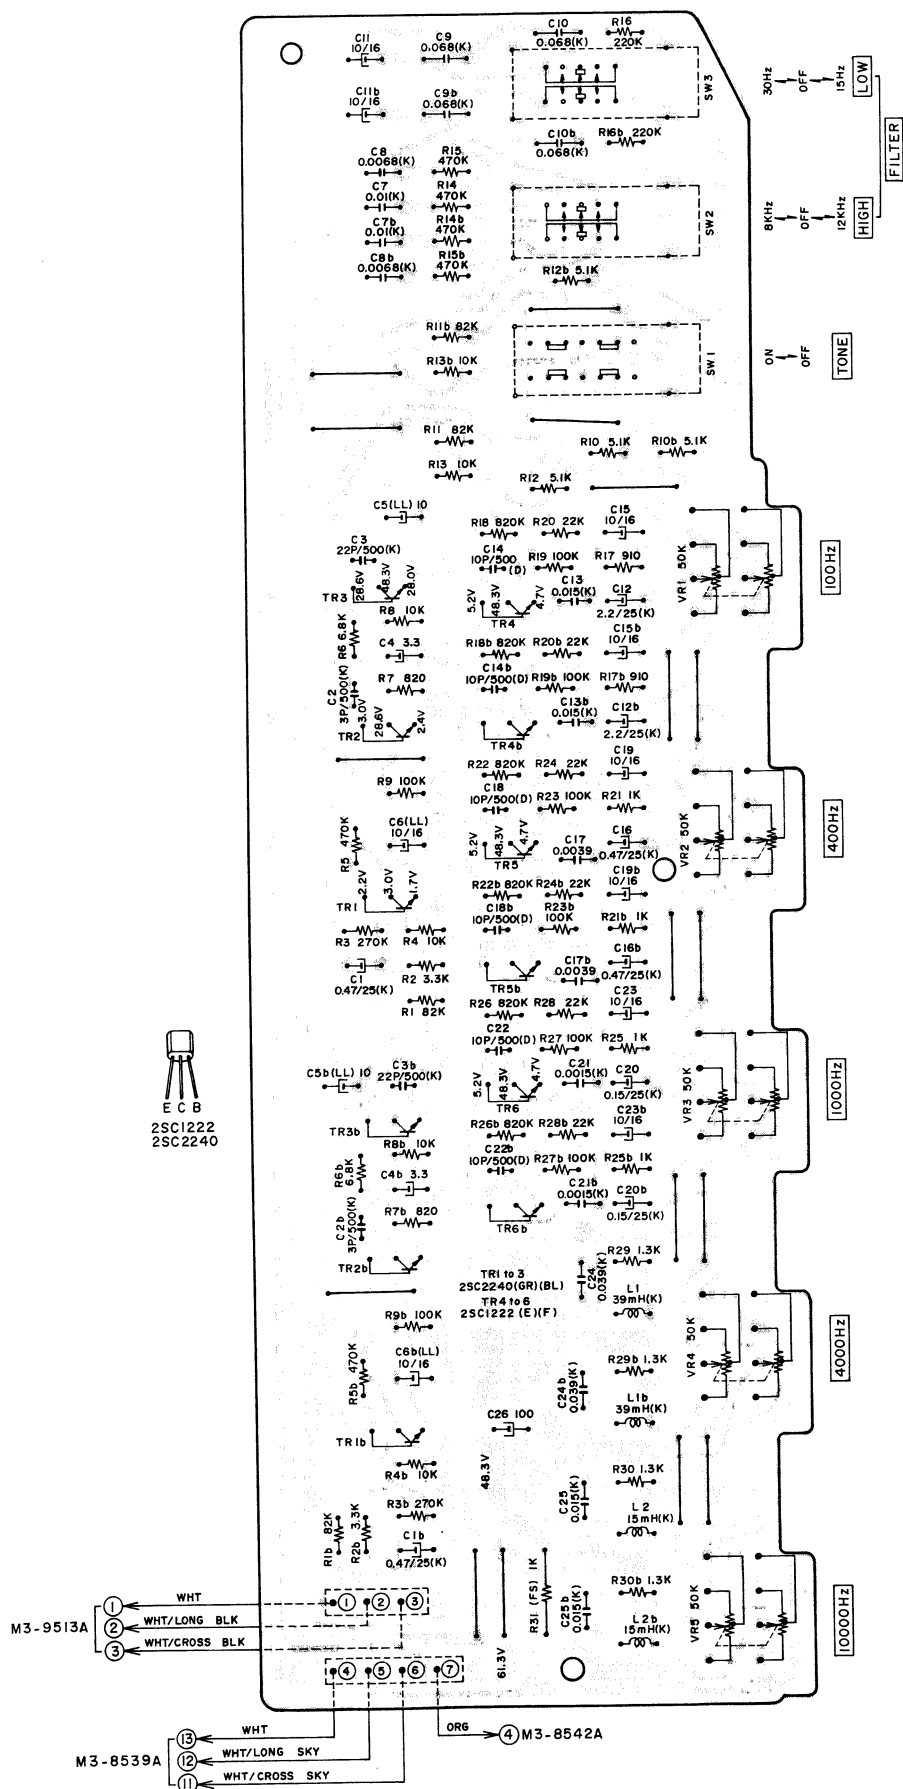

1) MAIN AMP (R) P.C BOARD M3-8542A(2ED) & TEMPERATURE COMPENSATION (R) P.C BOARD M3-8542B

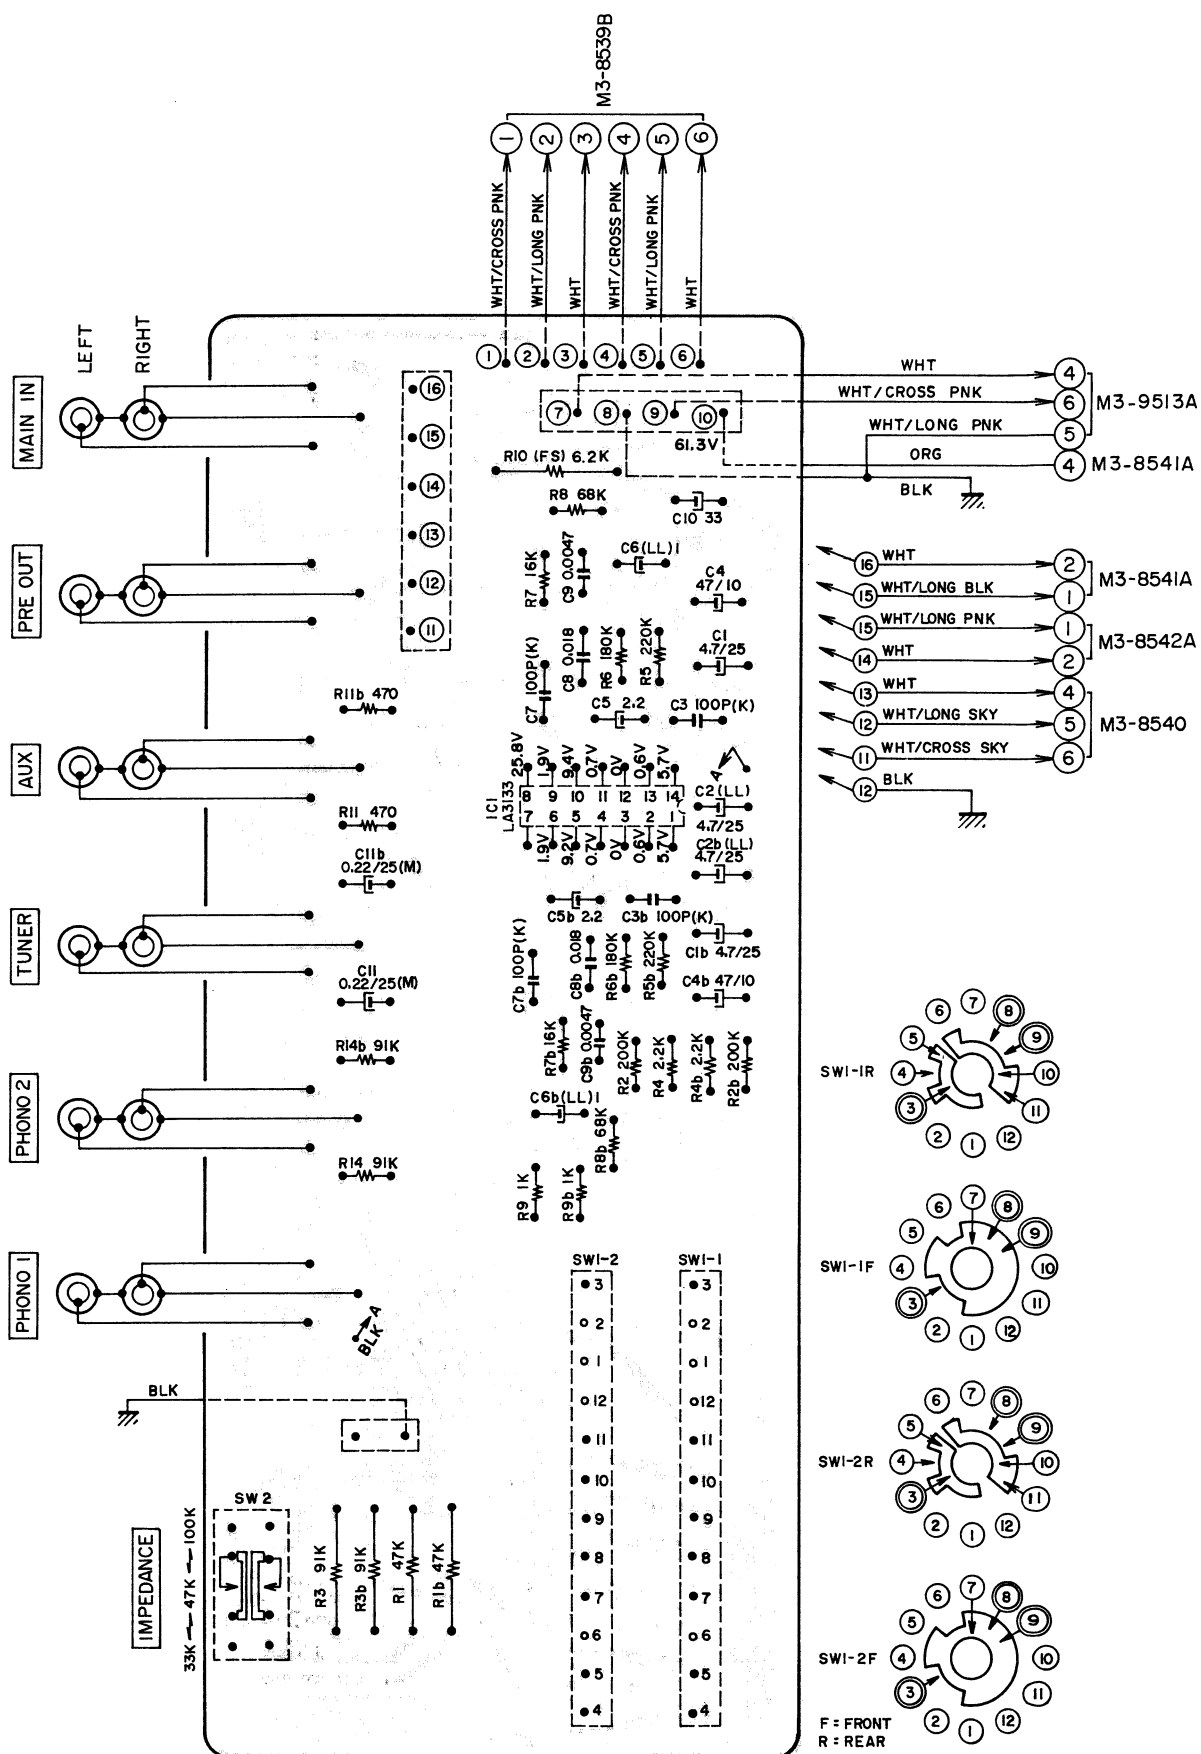

2) MAIN AMP (L) P.C BOARD M3-8541A, TEMPERATURE COMPENSATION (L) P.C BOARD M3-8541B & LED P.C BOARD M3-8541D

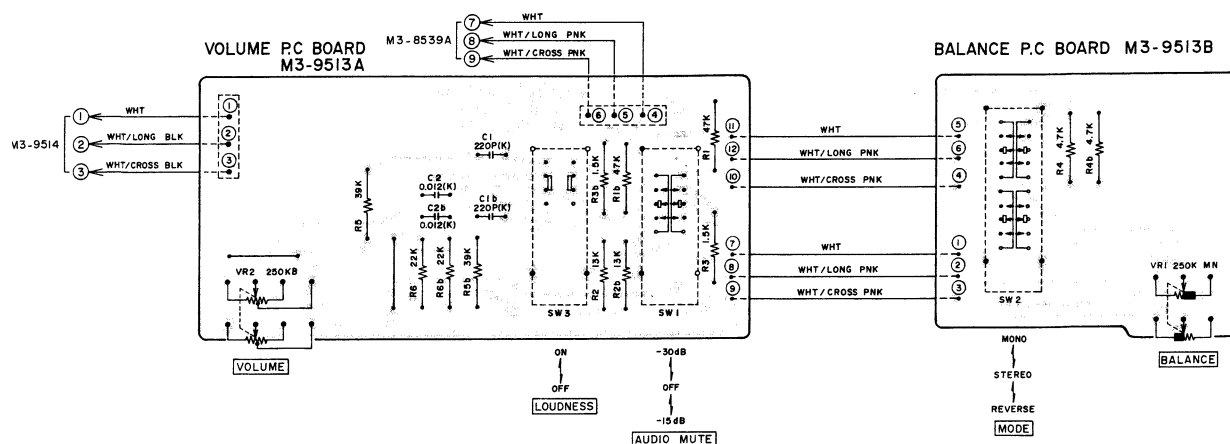

3) TONE CONTROL P.C BOARD M3-9514

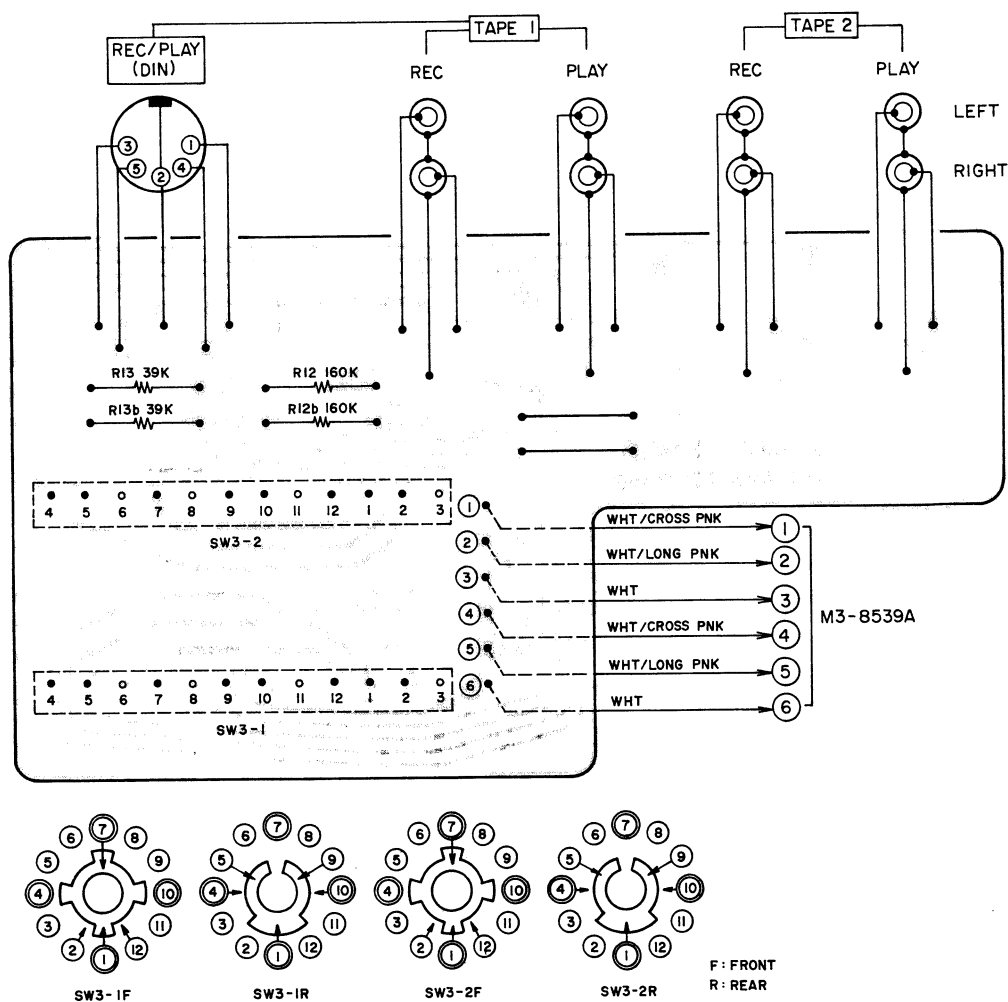

4) EQUALIZER P.C BOARD M3-8539A

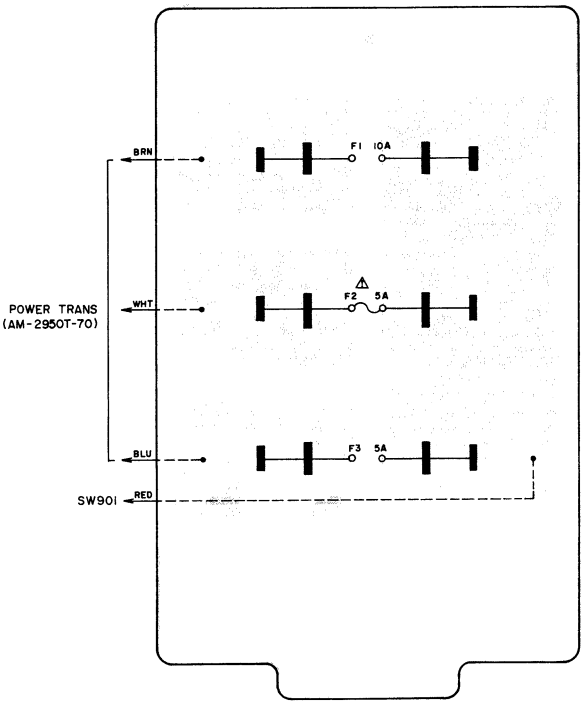

5) VOLUME P.C BOARD M3-9513A & BALANCE P.C BOARD M3-9513B

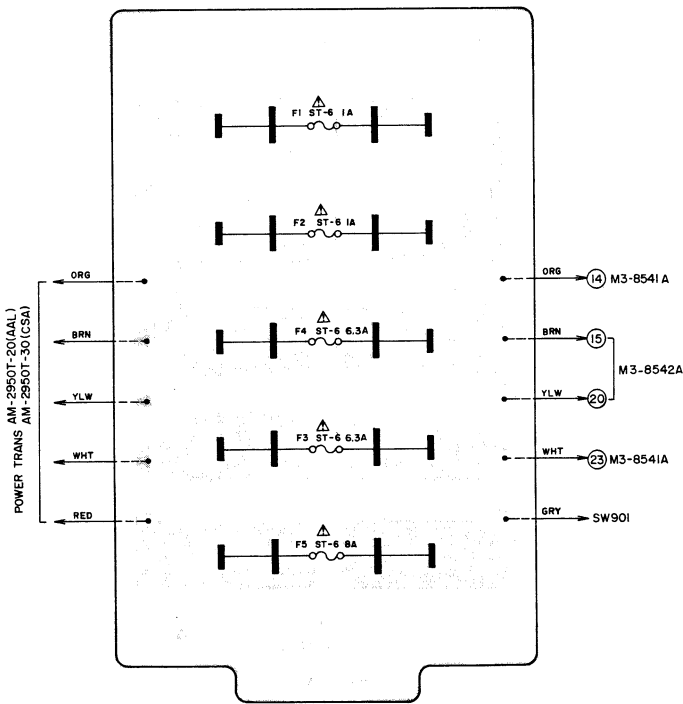

6) TAPE P.C BOARD M3-8539B

7) FUSE P.C BOARD (U/T) M3-8543

8) FUSE P.C BOARD (CSA, AAL) M3-9515

INDEX	35

Resistor and Capacitor which is not listed in this parts list, please refer to
COMMON LIST FOR SERVICE PARTS.

HOW TO USE THIS PARTS LIST

1. This parts list is compiled by various individual blocks based on assembly process.
2. When ordering parts, please describe parts number, serial number, and model number in detail.
3. How to read list.

FLYWHEEL BLOCK #13

12-115x	800425	Flywheel Block Assy. Comp.	RDG #13
12-116	244506	Flywheel Only	RD 233
12-117x	244754	Felt, Flywheel	RD 275
12-118	251324	Main Metal Case	RD 236
12-119	253080	Main Metal	RD 237

4. The symbol numbers shown on the P.C. Board list can be matched with the Composite Views of components of the Schematic Diagram or Service Manual.
5. The indications of Resistors and Capacitors in the photos of P.C. Board are being eliminated.
6. The shape of the parts and parts name, etc. can be confirmed by comparing them with the parts shown on the Electrical Parts Table of P.C. Board.
7. Both the kind of part and installation position can be determined by the Parts Number. To determine where a parts number is listed, utilize Parts Index at end of Parts List.
It is necessary first of all to find the Parts Number. This can be accomplished by using the Reference Number listed at right of parts number in the Parts Index. (meaning of ref. no. outlined in Item 3 above).
8. Utilize separate "Price List for Parts" to determine unit price. The most simple method of finding parts Price is to utilize the reference number.

CAUTION:

1. When placing an order for parts, be sure to list the parts no., model no., and description. There are instances in which if any of this information is omitted, parts cannot be shipped or the wrong parts will be delivered.
2. Please be careful not to make a mistake in the parts no. If the parts no. is in error, a part different from the one ordered may be delivered.
3. Because parts number and parts unit supply in the Preliminary Service Manual (Basic Parts List) may be partially changed, please use this parts list for all future reference.

WARNING: Δ INDICATES SAFETY CRITICAL COMPONENTS. FOR CONTINUED SAFETY, REPLACE SAFETY CRITICAL COMPONENTS ONLY WITH MANUFACTURER'S RECOMMENDED PARTS.

AVERTISSEMENT: Δ IL INDIQU LES COMPOSANTS CRITIQUES DE SURETE. POUR MAINTENIR LE DEGRE DE SECURITE DE L'APPAREIL NE REMPLACER LES COMPOSANTS DONT LE FONCTIONNEMENT EST CRITIQUE POUR LA SECURITE QUE PAR DES PIECES RECOMMANDEES PAR LE FABRICANT.

AC INLET SYSTEM

This model is equipped with an AC INLET SYSTEM. Please refer to the AC INLET SYSTEM CHART below for the specific type. By the AC INLET SYSTEM, AC (mains) cord can be connected to and disconnected from the model because the model is provided with socket exclusively for AC (mains) cord on its main body. Please note, however, that certain models are not equipped with this system and has a built-in AC (mains) cord as before.
